

# OVERVIEW: WHAT ARE SOCIAL NETWORKING SERVICES?

## 1. A CHANGING LANDSCAPE

“... technology has not only mediated communication in countless ways, but ... the very ways we communicate – and even the ways we talk and think about communication – are changing as a result.”<sup>1</sup>

Social Networking Services (SNS) are changing the ways in which people use and engage with the internet and with each other. Young people particularly are quick to use the new technology in ways which increasingly blur the boundaries between their online and offline activities. Social networking services are also developing rapidly as technology changes with new mobile dimensions and features. Children and young people within the UK, who have grown up taking the internet and mobile technologies for granted, make up a significant segment of “the beta generation”, - the first to exploit positive opportunities and benefits of new and emerging services, but also the first to have to negotiate appropriate behaviours within new communities, and to have to identify and manage risk.

Social networking services are also on the rise globally, and this change is also evident in increased UK engagement with sites. Ofcom's recent *International Communications Market 07* report<sup>2</sup> found evidence that more adults use social networking sites in the UK than in any other European country included in their survey. This is corroborated by ComScore data from August 2007<sup>3</sup> which suggest that UK internet users clock up an average of 23 visits and 5.3 hours on social networking sites each month. OfCom reported 39% of all UK internet users using social networking services, while the ComScore figures show 24.9 million unique SNS visitors in August 2007.

According to recent Hitwise figures, the most popular dedicated social network sites in the UK are [MySpace](#), [Facebook](#) and [Bebo](#).<sup>4</sup> These types of social networking services are **profile-focussed** - activity centres around web pages that contain information about the activities, interests and likes (and dislikes) of each member. While the number of visitors to social networking sites is increasing, so too are the numbers of new services being launched, along with the number of longstanding (within the relatively brief lifespan of the internet) websites that are adding, developing or refining social network service features or tools. The ways in which we connect to social networking services are expanding too. Games-based and mobile phone-based social networking services that interact with existing web-based platforms, or with new mobile-focused communities, are rapidly developing areas.

## 2. DEFINITIONS

Given the speed with which the online social networking landscape is developing, Social networking services necessarily refers here to the breadth of existing services, the place of existing services within the history of internet technologies and services, and the rapid development of new tools and practices.

**Social networking services can be broadly defined as internet- or mobile-based social spaces designed to facilitate communication, collaboration, and content sharing across networks of contacts.**

They allow users to manage, build and represent their social networks online. They are usually (but not always) made up of other individuals; they might also include the profiles of events, companies, even political parties. They may let you add anyone in the network as your "friend" or contact, or they might ask for all connections to be agreed by both parties. They typically support the public display of networks - although they may offer privacy restrictions, or facilitate closed communities. Permissions are a very important feature of most social networking services. They allow members and groups to control who gets access to their profiles, information, connections and spaces, as well as degrees of access. The level of granularity and control varies from service to service, but typically settings allow you to:

- keep your information private (i.e. seen by only those you give permission to see it), or
- restrict the visibility of your information to:
  - o signed in service members only
  - o people on your contacts list
  - o particular groups of service users.
- to make your information public generally so that even people who are not members or are not signed in as members of that service can see them

Through these combinations of permissions and privacy, users can manage a range of different relationships online, as well as manage their online presence - how they appear to friends, acquaintances, or the general public. Managing relationships online and managing your online presence are key to having fun with and using social networks safely. Young people are more likely to have developed personal strategies or learnt from peers, than from formal instruction and support from adults.

Social networking sites vary in the types of tools and functionality they provide (Boyd and Ellison<sup>5</sup> define social network sites as having three common elements: a member profile (in their definition this is always a web page); the ability to add other members to a contact list; and supported interaction between members of contact lists (interaction varies greatly, and there will typically be some degree of interaction facilitated between people who are not on each others contacts list))<sup>6</sup>.

Social networking sites are often perceived by their users as closed environments, where members talk to other members<sup>7</sup>. This impression of social networking services as providing a private space is likely to account for behaviour, language and postings that do not translate well outside of their intended closed context. While it's important that children and young people understand the public nature of much of their activity within social networking services (and can use permissions and privacy controls to manage personal information and communications), we also need to ensure that online activity is understood holistically - as the sum of activity of all the online sites and networks an individual belongs to.

### 3. TYPES OF SOCIAL NETWORKING SERVICES

This section attempts to order the current range of social networking services available, and outlines two main formats: sites that are primarily organised around users' profiles and those that are organised around collections of content<sup>8</sup>. However, it's important to remember that services differ and may be characterised by more than one category. Users are also quite happy to tailor the intended use of platforms to suit their own interests – so for instance, sites that are primarily profile focused may be used by individuals to showcase media collections or be used as workspace for particular topics or events. Educators setting up private groups in order to make use of collaborative space and tools are a great example of how social networking services can be tailored for users' own ends.

#### **Profile-based SNS**

Profile-based services are primarily organised around members' profile pages – pages which primarily consist of information about an individual member –including their picture, interests, likes and dislikes. Bebo, Facebook and MySpace, are all good examples of this. Users develop their space in various ways, and can often contribute to each other's spaces – typically leaving text, embedded content or links to external content through message walls, comment or evaluation tools. Users often include third-party content (in the form of "widgets") in order to enhance their profiles, or as a way of including information from other web services and social networking services.

#### **Content-based SNS**

In these services, the user's profile remains an important way of organising connections but plays a secondary role to the posting of content. Photo-sharing site [Flickr](#) is an example of this type of service, one where groups and comments are based around pictures. There are many people who have "empty" [Flickr](#) accounts – people who have signed up to the service in order to view their friends' or families' permission-protected pictures. [Shelfari](#) is one of the current crop of book-focused sites, with the member's "bookshelf" being a focal point of their profile and membership. Other examples of content-based communities include [YouTube.com](#) for video-sharing and [last.fm](#), where the content is arranged by software that monitors and represents the music that users listen to. In this instance, content is generated by the user's activity. The act of listening to audio files creates and updates profile information (recently listened to). This in turn generates data about an individual user's, neighbours' – people who have recently listened to the same kind of music.

#### **White-label SNS**

Most social networking services offer some group-building functionality, which allows users to form their own mini-communities within sites. Platforms such as PeopleAggregator ([www.broadbandmechanics.com](#)) and [Ning](#), which launched in 2004, offer members a different model, based on the creation and membership of users' own social networking sites.

These sites offer members the opportunity to create and join communities. This means that users can create their own "mini-MySpaces"<sup>9</sup>, small-scale social networking sites that support specific interests, events or activities. Setting up and running a social networking service also means increased responsibility/liability of the individual creator or host for onsite activity.

#### **Multi-User Virtual Environments**

Sites such as [Second Life](#) and [World of Warcraft](#), online virtual environments, allow users to interact with each other's avatars – a virtual representation of the site member. Although the users have profile cards, their functional profiles are the characters they customise or build and control. Friends lists are usually private and not publicly shared or displayed.

#### **Mobile SNS**

Many social network sites, for example [MySpace](#) and [Twitter](#), offer mobile phone versions of their services, allowing members to interact with their friends via their phones. Increasingly, too, there are mobile-led and mobile-only communities, which include profiles and media-sharing just as with Web-based social networking services. [MYUBO](#), for example, allows users to share and view video over mobile networks<sup>10</sup>.

### **Micro-blogging/Presence updates**

Micro-blogging services such as [Twitter](#) and [Jaiku](#) allow you to publish short (140 characters, including spaces) messages publicly or within contact groups. They are designed to work as mobile services, but are popularly used and read on the Web as well. Many services offer "status updates" – short messages that can be updated to let people know what mood you are in or what you are doing. These can be checked within the site, read as text messages on phones, or exported to be read or displayed elsewhere<sup>11</sup>. They engage users in constantly updated conversation and contact with their online networks.

### **Social search**

Social search engines are an important web development which utilizes the popularity of social networking services. There are various kinds of social search engine, but sites like [Wink](#) and [Spokeo](#) generate results by searching across the public profiles of multiple social network sites, allowing the creation of Web-based "dossiers" on individuals. This type of people search cuts across the traditional boundaries of social network site membership, although any data retrieved should already be in the public domain.

#### 4. WHAT DO PEOPLE DO ON SOCIAL NETWORKING SERVICES?

People use social networking services for countless activities. Among the most common uses, however, are:

- Connecting with existing networks, making and developing friendships/contacts<sup>12</sup>

Young people tend to use social networking services to communicate and socialize with their contacts and consolidate their existing friend networks – however, in the same way that some children and young people collect trading cards or kinds of toy, some young people use social networks to collect contacts to display their popularity.

- Represent themselves online, create and develop an online presence

Social network services provide purpose-built spaces for members to create and present an online representation of themselves, either within friendship or wider networks

- Viewing content/finding information
- Creating and customising profiles

There are many different kinds of profiles, although they typically consist of a member-designed web page, supported by a range of tools. Profile pages are not just lists of information – they allow members to develop and present an image of themselves to the world, and to establish and project their online identities. Displays of preferences (favourite music, books, films for example) allow members to share information about themselves. Most social networking sites also allow members to customise the look and feel of their pages to a greater or lesser extent – through page templates or content, including video, widgets, music and images.

- Authoring and uploading your own content

Content might be in the form of messages or blog posts – it might also be photos, video or music.

- Adding and sharing third party content

This might be in the form of links or embedded content hosted somewhere else – for example a video hosted at [YouTube](#) or another video hosting service, but playable on a member's profile page. Content might be added in widget form - widgets are a chunk of code, usually provided by third party developers, that can be embedded within web pages to display various types of content – these can be simple badges (pictures with links back to other sites) or dynamic content, for example, a slide show or the last songs catalogued by my [last.fm](#) account. This type of dynamic content makes it easy to move information, content and links from one social networking service to another. Quizzes and polls are also very popular to share – with some services allowing you to create your own quizzes, or compare your self with other people on your contacts list who have also answered questions or added that application.

- Posting messages – public & private

Many services support public and private messaging – through message boards or in-service email. [MySpace](#) and [Facebook](#) offer members an Instant Messaging system.

- Collaborating with other people

Service tools to create groups but allow users, for example, to collectively create profiles, hold discussions, store, share and comment on objects. In-service messaging can be a rich source of informal collaboration.

## 5. YOUNG PEOPLE AND SOCIAL NETWORKING SERVICES

Many mainstream social networking services are aimed at teens and young adults. Most services have a minimum membership age of 13 or 14, and many will explicitly state they are designed for over 18s. There may be safety restrictions on the accounts of 14–17-year-olds– for example, whether their profile appears in public or off-site searches. There are sites specifically designed for young people – for example, both [Teen Second Life](#) and [Habbo Hotel](#) are aimed at teens. [Imbee.com](#) is primarily a blogging service for tweens (children aged 9-13), requiring a parent's permission to sign up. Both [Disney](#) and [Nick.Com](#) have dedicated services for children, Disney having recently acquired [ClubPenguin](#), a virtual world social networking service aimed at 6-to-14 year olds, in August 2007. Children and tweens can create penguin avatars, or online representatives, for which they can "buy" (with virtual money earned in in-world games) clothes, accessories, pets, homes, furniture, etc.

Services aimed at younger children typically have stricter privacy settings, greater levels of moderation and more limited user interactions. Some require parental permissions – for example, requiring sign up, usually with a credit card - and set preferences, such as the level of in-world communication allowed. As opportunities for contact are limited by safety settings, such child-focused sites may be less suitable for collaborative educational practices and projects than mainstream sites, which make collaboration and contact far easier – factors which bring about their own challenges. The National School Boards Association (US) recently released research findings of an exploration into the online behaviours of US 9 to 17 year olds<sup>13</sup>. Their sample included 2,300 children, young people and parents. Nine-to-seventeen year olds reported spending almost as much time on social networking and web sites as they do watching television – around 9 hours online, compared to 10 hours of TV. Ninety-six percent of the young people surveyed reported using some form of social networking technology, and the findings indicated that education-related topics are the most common, with 60% talking about education-related topics and 50% discussing their schoolwork. What is clear is that young people regard social networking services as just another part of their social and often school-related activities. Accordingly, educators, parents and carers are increasingly recognizing the importance of understanding the appeal and use of social networking service amongst young people. This may be in order to prevent or respond to a negative incident – cyberbullying, or other inappropriate content or activities - but should also be in order to realise the benefits of young people's use of technology: to support their media literacy skills and their social participation, and also to explore the potential educational benefits of social networking services.

- 6 Danah Boyd has written at length on definitions of social networking sites, focusing on characteristics she has identified as their unique, key service features. The approach taken here in the Digizen report is a far broader one, and includes a wider subset of social media which is organized around networking practices, within the label “social networking services (SNS)”. This definition takes in the range of activity that takes place across sites for educators - for example the use of collaborative and other tools which may not be unique to Social Networking Sites but nevertheless make up an important part of the user’s experience.

- 7 Alessandro Acquisti and Ralph Gross’s research on Facebook found significant misconceptions in members’ perceptions/awareness of the scope and openness of the network and the visibility/public availability of their profiles, on the one hand, and reality on the other hand. Members in the study felt their information was far more private than it actually was, and misjudged the numbers of people they were making personal information available to. Acquisti, A. & Gross, R. (2006) *Imagined Communities: Awareness, Information Sharing, and Privacy on the Facebook*. - 8 Fred Stutzman describes these as consisting of ego-centric and object-centric networks. These are interesting but limited distinctions – profiles may not be about individuals or self-representation, they may be about services, organisations, causes, imaginary people or fakester profiles – profiles of people pretending to be famous or historical figures, for example. Additionally, the profile is itself an object or an artefact.

12 Boyd and Ellison (2007) write: "What makes social network sites unique is not that they allow individuals to meet strangers, but rather that they enable users to articulate and make visible their social networks. This can result in connections between individuals that would not otherwise be made, but that is often not the goal, and these meetings are frequently between "latent ties" (Haythornthwaite, 2005) who share some offline connection. On many of the large social networking services, participants are not necessarily "networking" or looking to meet new people; instead, they are primarily communicating with people who are already a part of their extended social network. To emphasize this articulated social network as a critical organizing feature of these sites, we label them "social network sites."
